

JSON data class for REST calls

Phillip G. Bradford*

March 29, 2025

Abstract

These notes discuss a Javascript JSON data class: `JsonContainer`. All of our data-classes that store data from the APIs inherit from `JsonContainer`. All of these data classes use the class `CardText.js` to get their header-text. Specifically, `CardText.js` is a single-source for the cards header-text. The Stacks APIs all have a single-source for the endpoints we use. This source is stored in the file `RoutesAndEndpoints.js`.

1 `JsonContainer` class

The class `JsonContainer` is the base-class for our data classes:

1. `BurnBlockContainer`
2. `PoxCycle`
3. `StacksBlock`
4. `TenureTxContainer`

The class `JsonContainer` is in Listing 2.

```
1 export default class CardText {  
2   static CARD_TITLE_BURN_BLOCK = "Burn Block";  
3   static CARD_TITLE_POX_BLOCK = "Pox Block";  
4   static CARD_TITLE_STACKS_BLOCK = "Stacks Block";  
5   static CARD_TITLE_TENURE_BLOCK = "Tenure Transaction";  
6 }
```

Listing 1: The single-source of text for cards on the screen

The class `CardText` in Listing 1 can be extended to hold other fields besides these `CARD_TITLE...`s. A key reason for storing all card text in one common file is to make translation and updating easy.

```
1 class JsonContainer {
2     constructor(data = {}) {
3         this.setData(data);
4     }
5
6     setData(data) {
7         if (typeof data !== "object" || data === null) {
8             throw new Error("Data must be a valid JSON object");
9         }
10        this._data = { ...data }; // Clone
11    }
12
13    getData() {
14        return { ...this._data };
15    }
16
17    toJson() {
18        return JSON.stringify(this._data, null, 2);
19    }
20 }
```

Listing 2: `JsonContainer` class

Each class that inherits from the class `JsonContainer` has a constructor as seen in Listing 3.

```
1 export default class BurnBlockContainer extends JsonContainer {
2
3     constructor(data = {}) {
4         super(data);
5         this.setData({...data,
6             "card_title" : CardText.CARD_TITLE_BURN_BLOCK});
7     }
8 }
```

Listing 3: `BurnBlockContainer` inheriting from `JsonContainer`

The data passed into the class `BurnBlockContainer` may be modified to suppress some fields from being presented. This will be on a block-type by block-type basis.

2 Notes

ES6 (ECMAScript 6) is ECMAScript 2015.
React is based on ES6.
